

A satellite map of North America showing land cover dynamics from MODIS Collection 6. The map uses a color scale where red and orange indicate higher vegetation indices, while blue and green indicate lower indices. The map shows the continental United States, southern Canada, and northern Mexico. The background is black, representing the oceans. The text 'MODIS Collection 6 Land Cover & Land Cover Dynamics' is overlaid in white on the lower left.

MODIS Collection 6 Land Cover & Land Cover Dynamics

MODIS Science Team Meeting 2016
Josh Gray, Damien Sulla-Menashe, Mark Friedl

The MCD12 Products

- Primary inputs are MCD43A4/2 products
- MCD12Q1 and MCD12C1
 - Global, annual land cover at 500 m and 0.05°
 - 6 Types: IGBP, UMD, LAI/fPAR, NPP/BGC, PFT, LCCS
- MCD12Q2
 - Global, annual land surface phenology at 500 m
 - Start and end of season, integrated greenness

MCD12 Collection 6

- MCD12Q1/C1 and MCD12Q2 both use:
 - *Daily* Collection 6 NBARs
 - Spline smoothing of band time series
 - Snow screening and filling

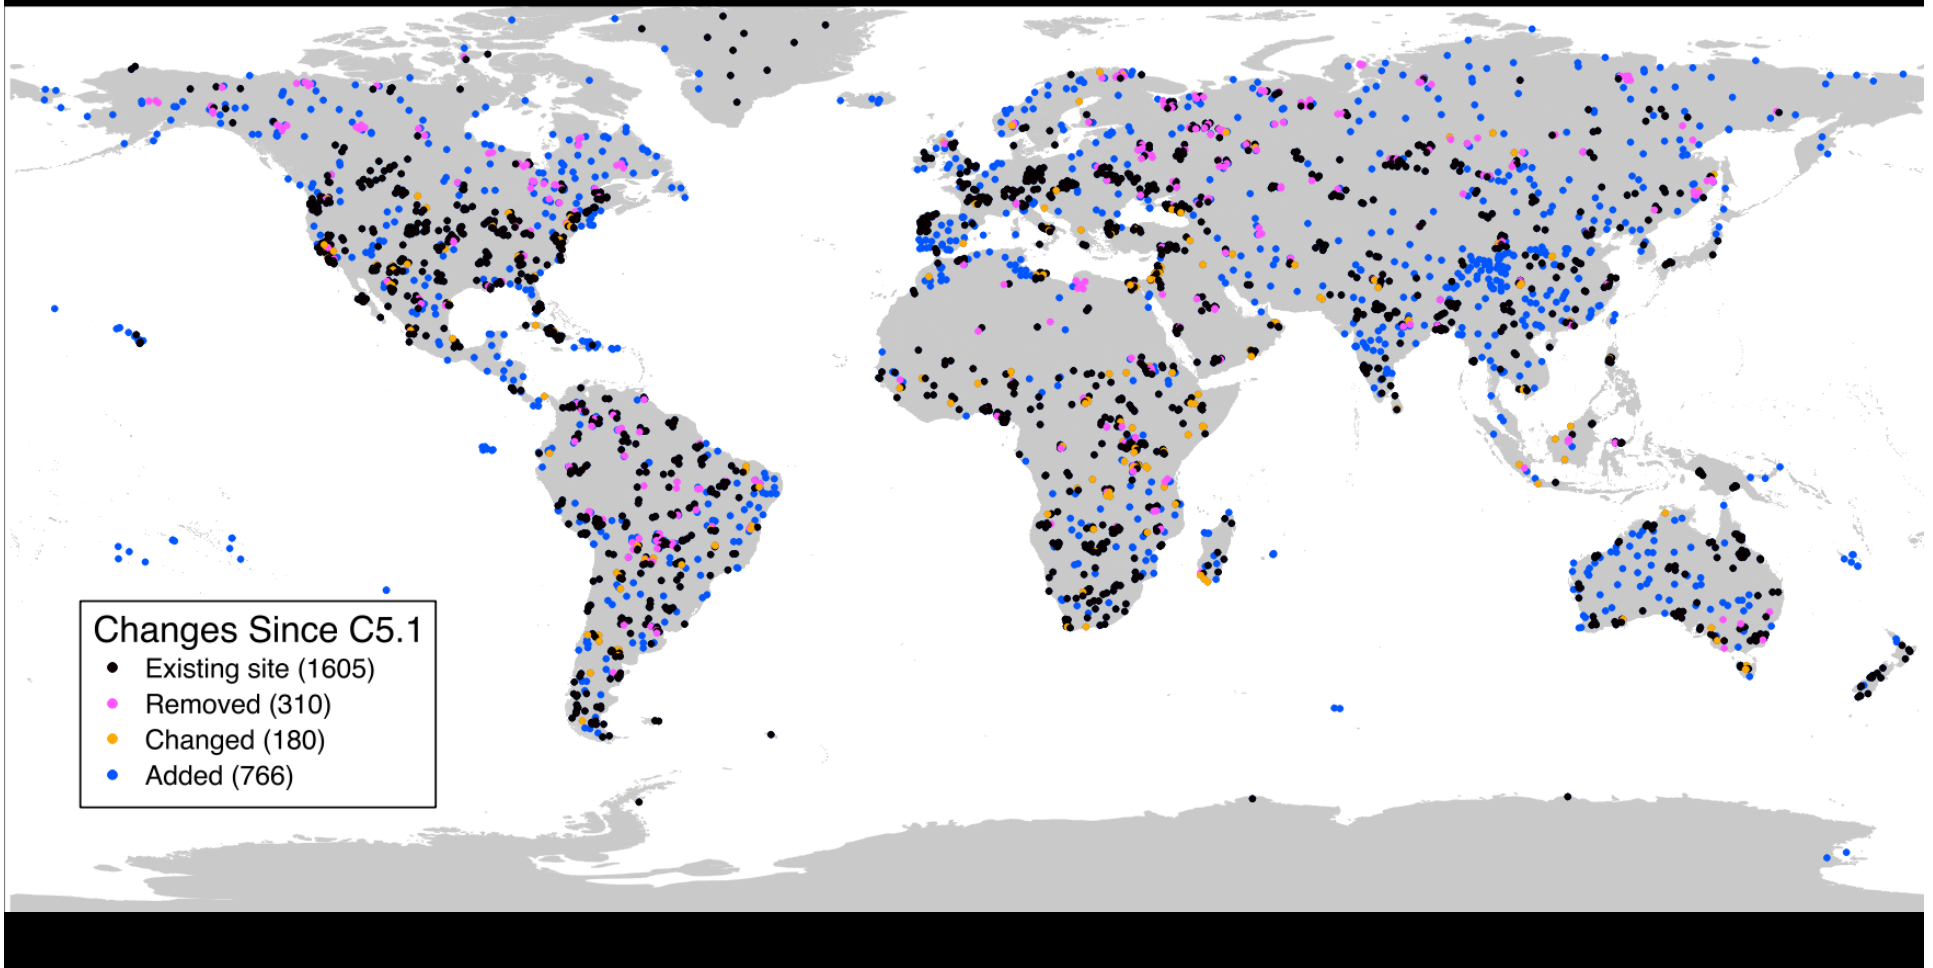

MCD12Q1 Improvements

- Hierarchical classification approach
- RandomForest instead of C4.5
- Improved training data (STEP)
- Improved feature set
- Hidden Markov model (Abercrombie and Friedl, 2016 IEEE TGARS)

STEP Changes

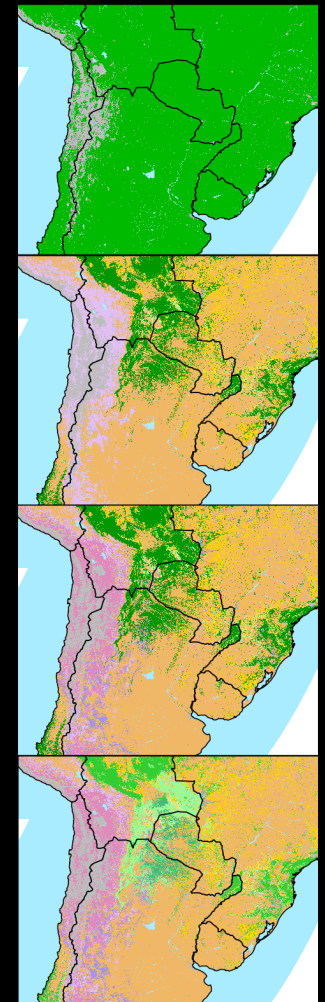

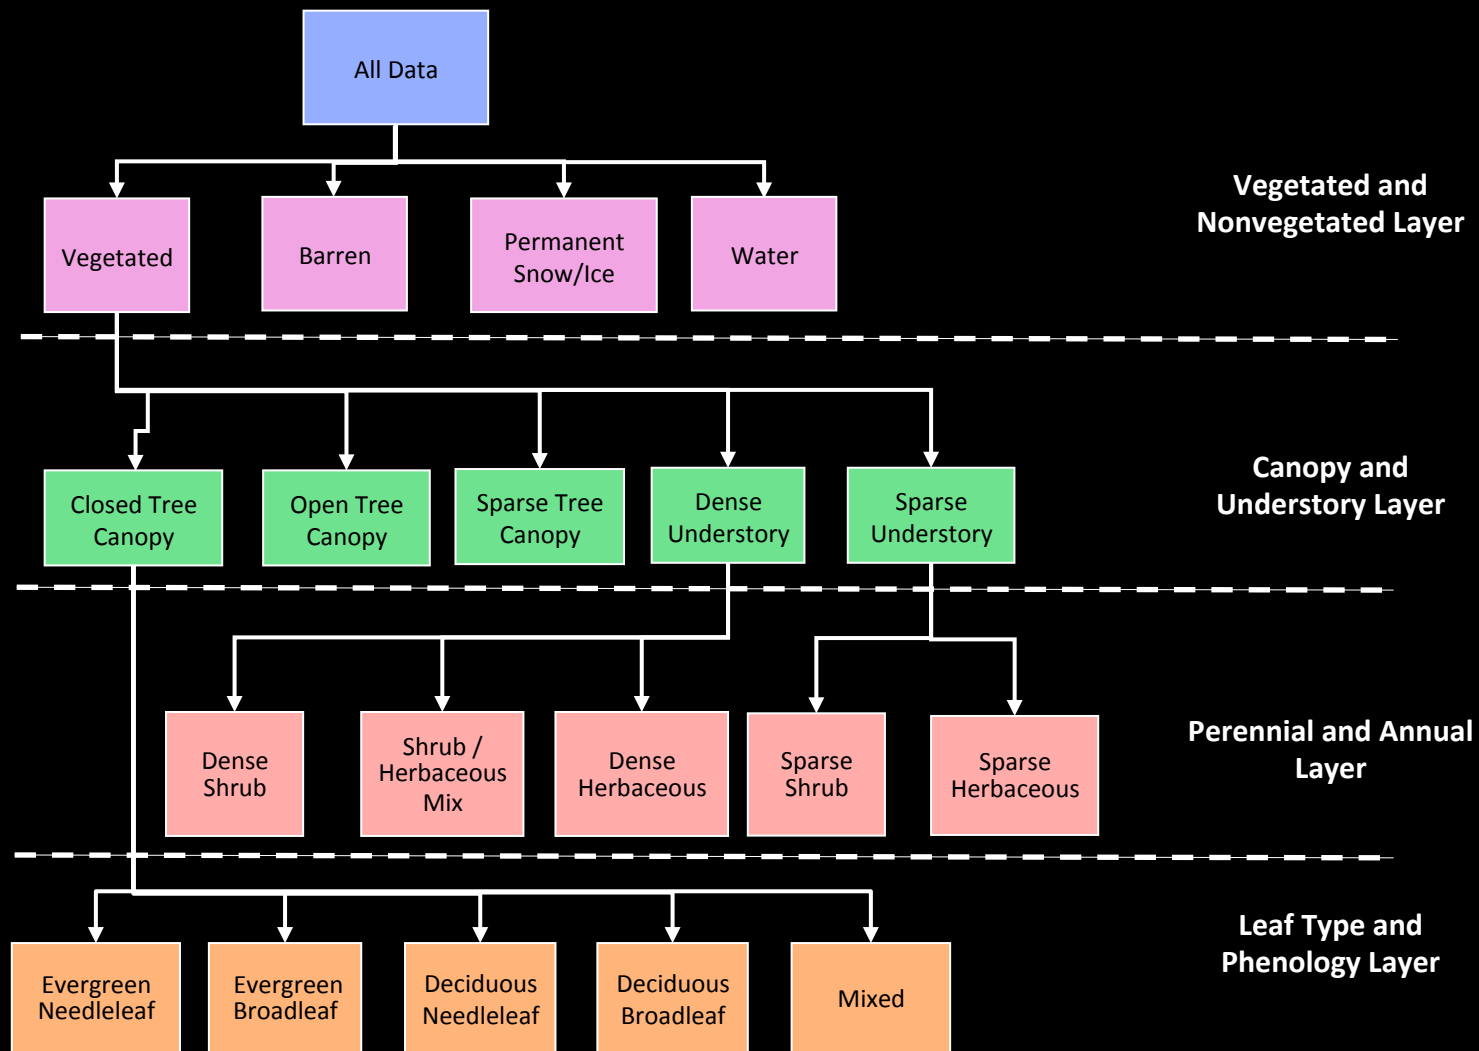

47% more STEP sites
31% of sites modified or removed

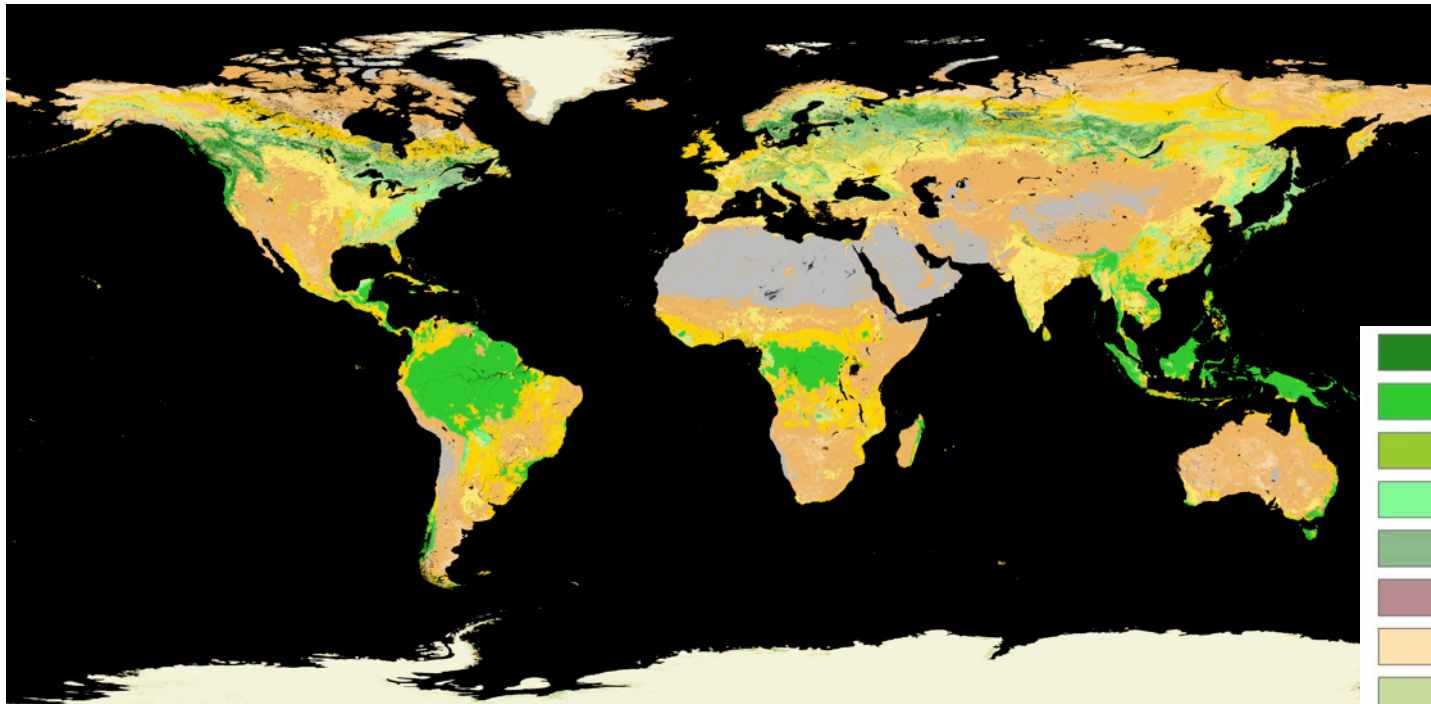

Improved Algorithm and Classification Inputs

	V5	V6
Feature Set	<ul style="list-style-type: none"> • Monthly NBAR (7 bands), EVI, and LST. • Annual metrics (min, max, mean) for each feature. 	<ul style="list-style-type: none"> • Annual metrics for growing season: from NBARs (7 bands) and vegetation indices (EVI2, NDII1, NDII2, NDWI, NDSI)
Classifier	C4.5 Decision Tree	RandomForest Classifier
Ancillary Data	<ul style="list-style-type: none"> • MODIS V5 land-water mask • V5 urban layer • Prior probability layers based on Collection 4 data with agriculture intensity data 	<ul style="list-style-type: none"> • MODIS V6 land-water mask at 250-m • Updated V6 urban layer • Prior probability layers based on: <ul style="list-style-type: none"> • New agriculture intensity data • Climate-based classifications • MODIS Vegetation Continuous Fields product

New LCCS Layer

C6

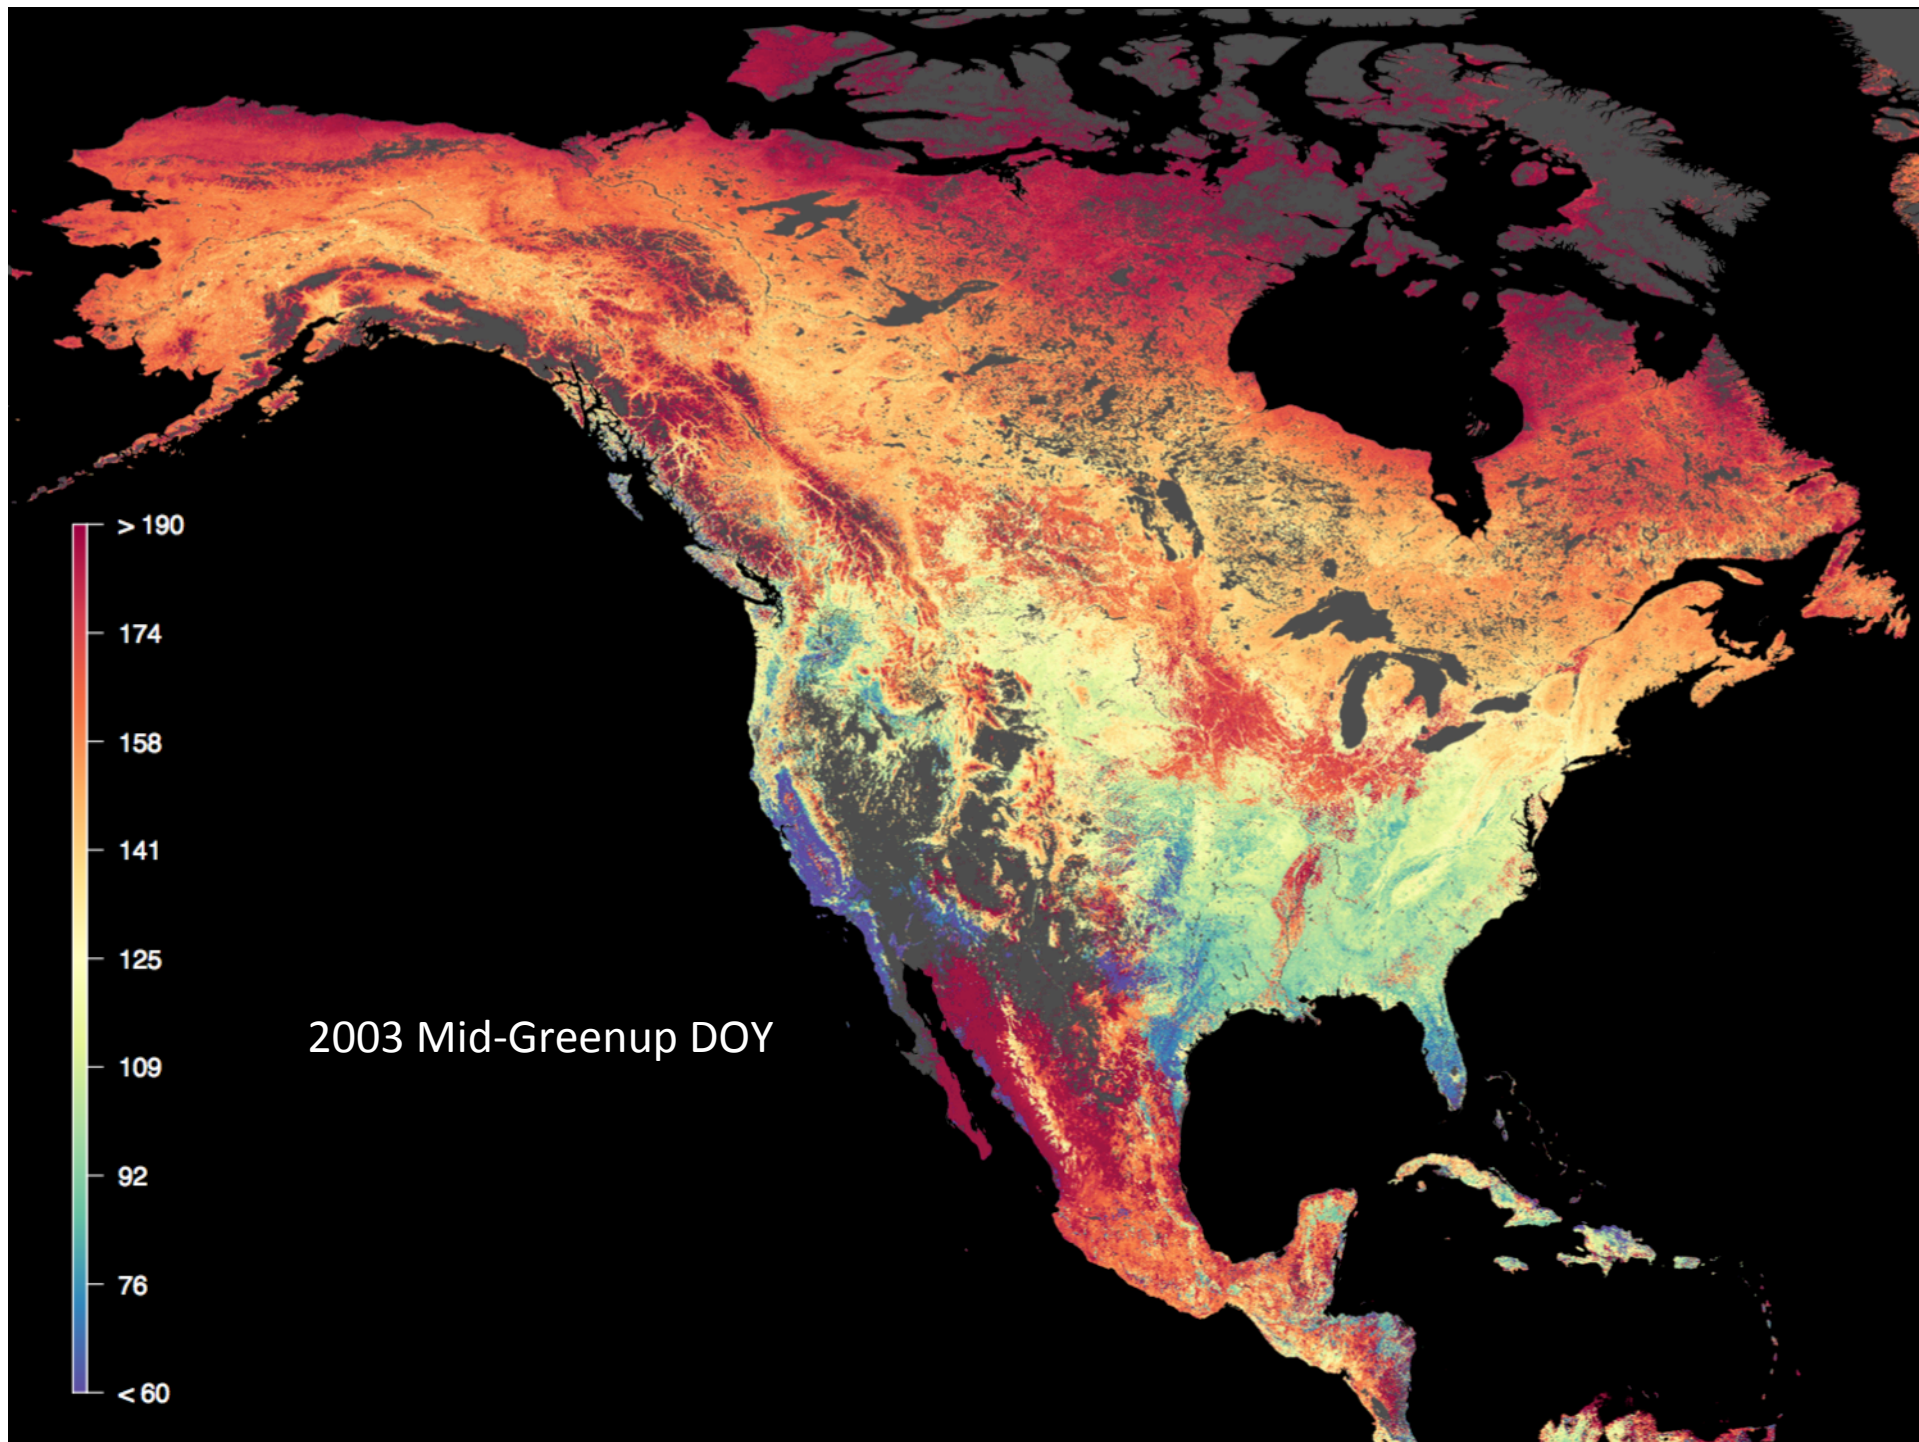

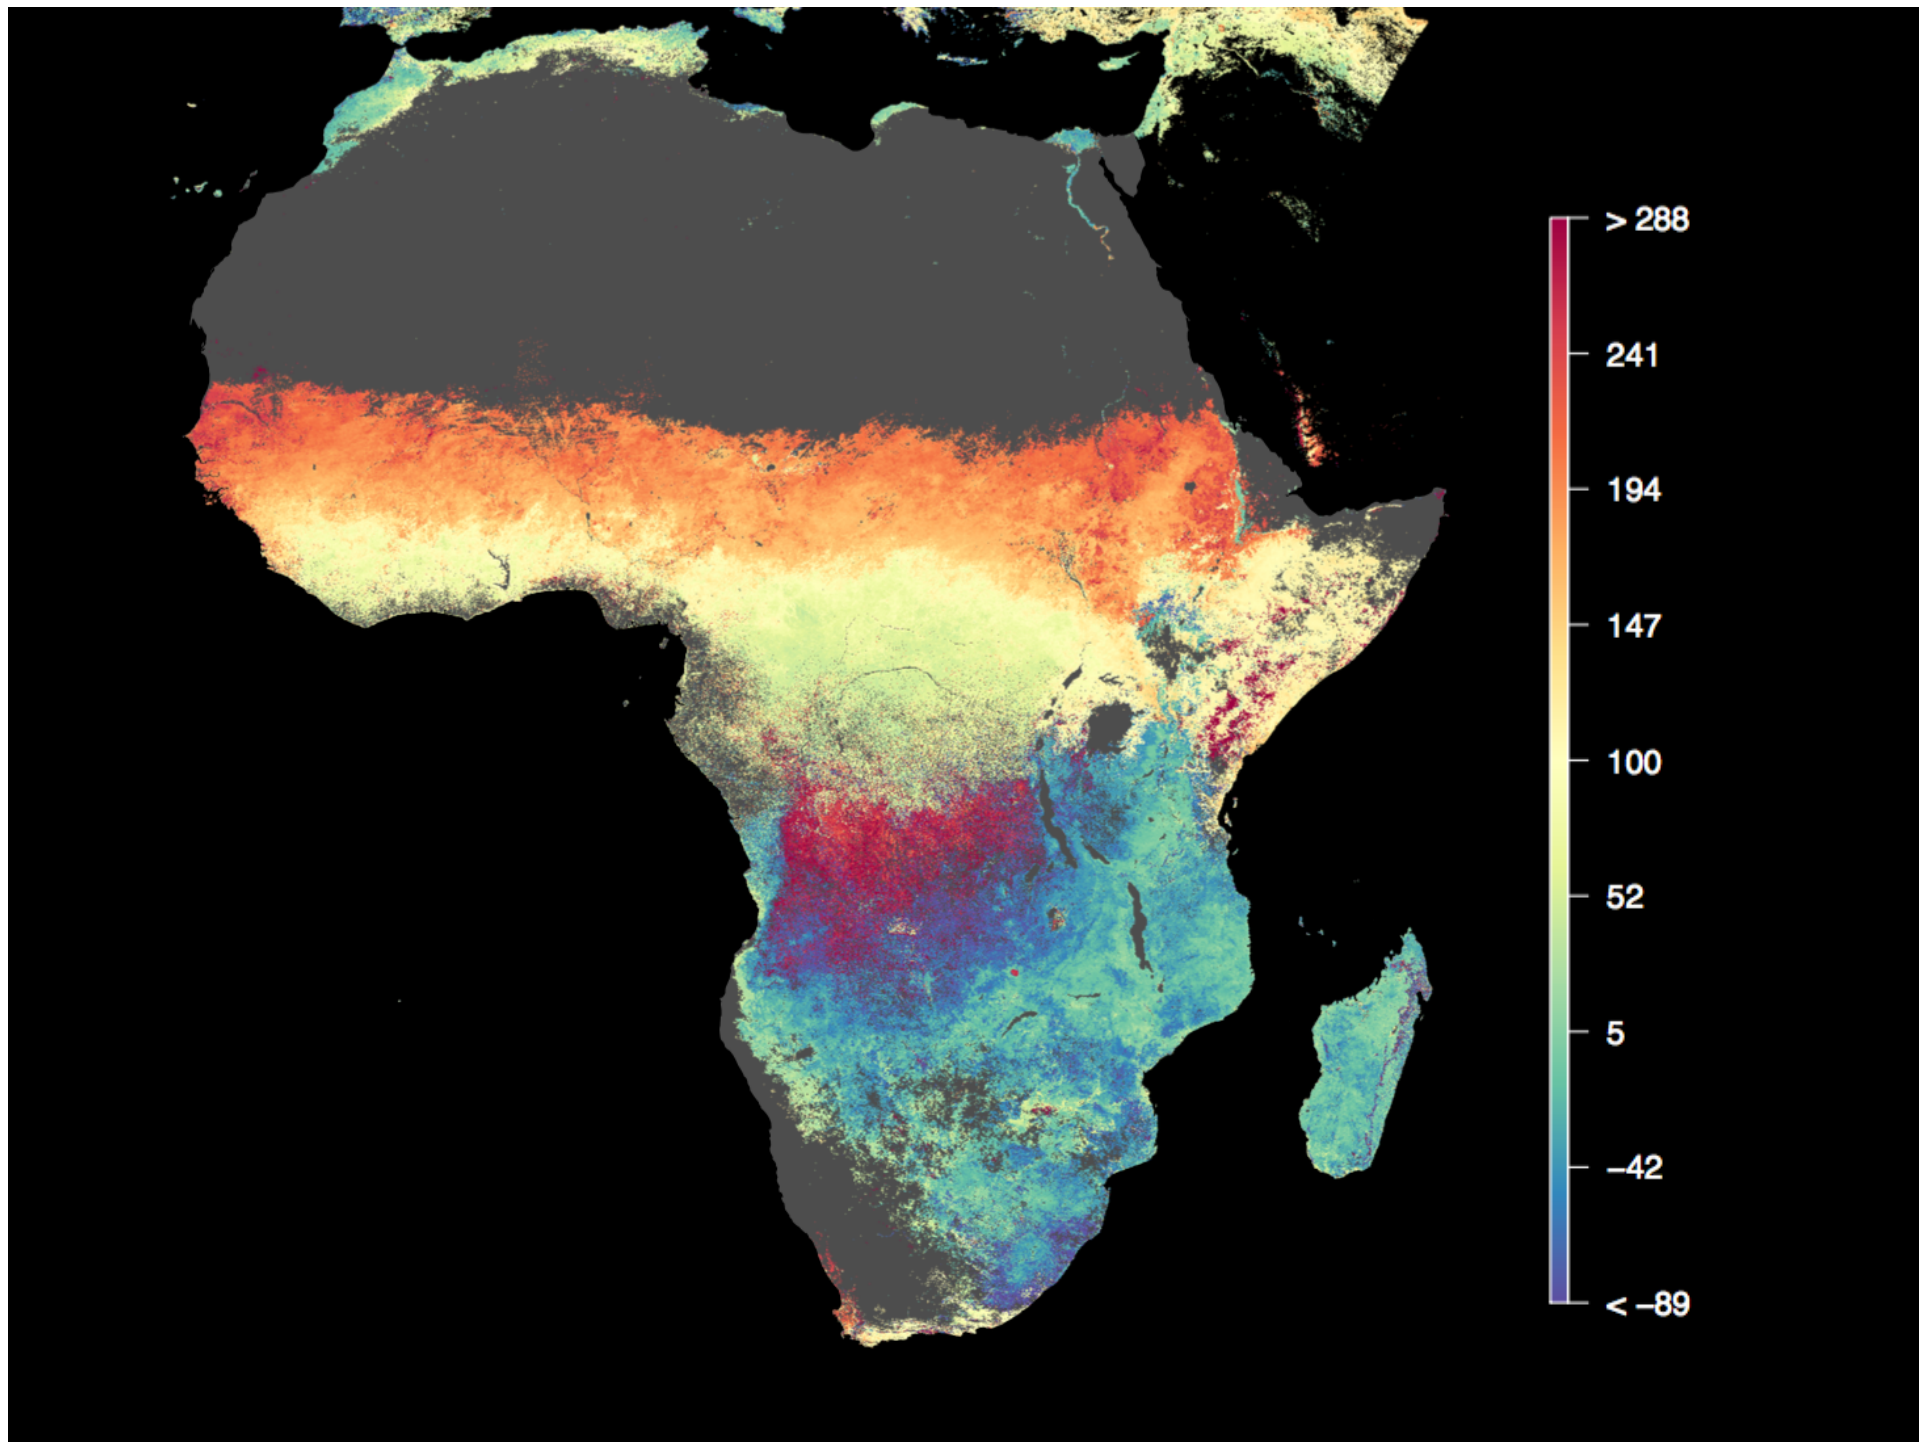

C5

MCD12Q2

- What's new in C6?
 - Relative thresholds of splined NBAR-EVI2 rather than inversions of piecewise logistic functions
 - New SDS: peak, midpoint of GUP/GDOWN
 - Improved QA: QA value for each phenometric; weighted sum of missing data in vicinity of phenometric and spline goodness of fit

Phenometric-specific QA

QA score is weighted sum of fraction missing in month centered on phenometric and spline R^2 (80% and 20%, resp.)

Continuous scores collapsed to 1-4 qualitative score

Extracting Phenology Data From Webcam Images

RGB Color Model

RGB Triplet:

$$(R_{DN}, G_{DN}, B_{DN})$$

Canopy "Greenness" (GCC)

$$= \frac{G_{DN}}{R_{DN} + G_{DN} + B_{DN}}$$

50% Greenup Assessment with Melaas et al. Landsat method 2001-2014

Bars are standard errors across pixels within site

Moving Forward

- Code migration to Goddard, will be processed on the PEATE like most other products
- Ongoing assessment and refinement
- Working with XYZ for VIIRS continuity
